October 16, 2019

## 1 Introduction

Testing is an important part of development, whether it is software or hardware. Unfortunately, not many developers went out their way to test their product. Testing can be highly time consuming and expensive. However, it is still an essential part of development of a product. Therefore, this paper will present my test plan for this semester. This paper will outline the process of testing the functionality of software.

## 2 Acquired Resources

Resources needed to perform the test:

- A computer.
- IDE to run the code.
